Final Project Proposal

As you may know the world's population is constantly growing at a 1.1% rate per year. This means that the population is growing roughly about 83 million people annually, roughly 1.5 million people each week, or about 220,000 people per day. This is equivalent to about 9,000 or more people every hour, or 150 more people per minute. Growing from 1 billion in the 1800's to more than 8.1 billion now in 2024. With this very rapid population growth, “demographers expect the world population to peak by the end of this century” (ourworldindata.com). While some may overlook this information it should be noted that information like this tells the future. Since our human activity is continuously growing this means that Earth’s resources are constantly diminishing. With “the overconsumption of natural resources like forests, water, and minerals exceeding the planet's ability to replenish them, leading to environmental degradation and potential future shortages if not addressed effectively; this means we are using more resources than the Earth can regenerate, essentially "spending" the planet's natural capital faster than it can be replenished” ([DepletionStatics](https://depletionstatics.com)).

Although let’s not panic just yet, the pure duty of this website is to expose some of the government's secrets in regards to what’s next? How will the government deal with the rapid diminish in our resources? Well, I know you may have heard about the conspiracies on how ‘The

Simpsons' show tells many predictions about the future that have ended up being true. Well the movie *Downsizing* directed by Alexandra Payne is spot on about our future. The movie is about a couple who decide "to undergo a process in which scientists shrink people down to miniature size to live in small communities. The irreversible procedure allows the people to gain wealth and a life of leisure while helping to cut down on the consumption of natural resources" (GoogleAboutDownsizing). This may seem like an absurd idea, but experimentation has already occurred in Miniature Genes Clinical Laboratory. I am Daniel Chester; a scientific researcher from Miniature Genes Clinical Laboratory here to let you know that **THE PROCEDURE** is almost ready.

While it is very risky for me to be exposing this information, I just needed to let humanity know that the time is coming. We will not have to fight over toilet tissue like during the 2020 COVID pandemic — we won't have to worry about inflation anymore. At a miniature size our resources will be unlimited and the population can grow as much as it wants. Starting in 2030, this new life of living miniature will be available to all. While it is purely your decision, just know that this may be the start to saving the world. That's why **YOU SHOULD TAKE A STEP INTO A MINIATURE LIFESTYLE!**

Explanation Excerpt:

I wrote the beginning part of my proposal from the perspective of a fictitious alter ego, a part of this fictitious organization . The truth is ultimately that the population is growing rapidly and the resources are depleting faster than they can be replenished. This topic is a very real topic that should draw people in because it ultimately affects them. While the fictitious truth is

that the government is planning to shrink people to miniature sizes to live in miniature worlds.

This miniature world will overall be the solution to having unlimited resources. As you can see, the excerpt uses very real events and information to back up this new found discovery.

Ultimately making this project become a “benevolent truth” because its true intentions are to help people understand that a “solution” is near for very real problems within the world.
